I have written a lot about what I call spectrum holes in the 225-400 MHz range in the pages of *Monitoring Times* magazine over many years. Now it is time to introduce my online audience to this concept.

In brief, a spectrum hole is a legit frequency for assignment based on current channel spacing, but no activity/current assignment has ever been heard/found for a frequency. That is a spectrum hole.

So if you want to do some cutting edge exploration of the UHF Milair band and claim a few first of your own, grab an extra scanner or memory locations, plug in frequencies from our spectrum hole list and let us know what you hear.

When reporting activity on any of the spectrum hole frequencies in our list, be sure to pass along any info that can help identify the user and frequency usage. Also let us know if you want your catch listed here and how you want to be identified. This list is valid for ITU Region 2 only (North/Central/South America). Other areas of the world have their own bandplans.

So let's get cracking and let us know if you hear activity on any of our mystery frequencies below. Who will be the first to catch and report a true radio mystery?

Note: This list will be posted in segments and is not yet complete for the 255-400 MHz entire spectrum. Be sure to check the MT Reader Only site for future updates.

Note: Any frequency below that is bolded should be watched very closely and those marked with an asterisks are high priority frequency targets.
